

## Lumacord

### Instructions on how to do it yourself

#### Step 1.

Take rope and fiber optic cable and place them side by side. Please make sure that you have a sufficient length of Fiber Optic Cable to attach it to a light case. Please take into account the length of Fiber Optic Cable when considering the distance to a power socket or to place the light case discretely.

#### Step 2.

Intertwine rope and fiber after every three lays of rope. Press gently when placing Fiber Optic Cable into the rope groove.

#### Step 3.

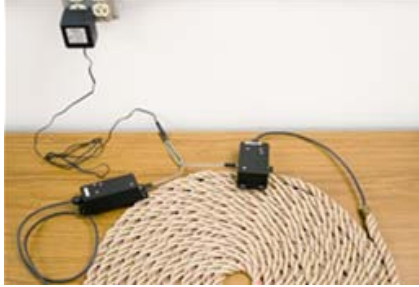

Repeat step 2 all along the length of rope.

#### **Step 4.**

**When you are finished, please use tape, string or glue to keep rope from fraying.**

#### **Step 5.**

**Attach light case to Fiber Optic Cable. Power splitter enables you to work with two light cases. If you desire to obtain secondary colors, you can experiment with several light cases as well.**
